

Dear Derek Buchanan,

I'm not sure that we are getting anywhere. The worst structural aspect is that the Advanced Drafts have completely mucked up the order in which calculus is presented.

* Calculus is not developed thoroughly just with algebraic functions before the special functions e^x and $\sin x$ are introduced.

* The calculus of the special functions is developed in a haphazard fashion.

* No calculus or application of calculus follows integration, and constants of integration are almost forgotten.

* There are hardly any applications of calculus, and in particular, motion has almost disappeared.

It will be an act of vandalism if they persist.

Regards,

Bill Pender
